(54) Genitalia external prosthesis for treatment of male external genitalia hypoplasia

(57) The invention describes a device designed for the treatment of the external male genitalia hipoplasia, creating a growth of tissues and a correction of existing curvatures.

The invention's device is unique for using an external genitalia fixation (1; 13) associated to a diametric system (5) and to a gland protection system (15). The system of external genitalia inferior fixation (1) and superior (13) produces on the external male genitalia a traction force. The diametric system (5) creates on the male genitalia a tissue expansion. The gland protection system (15) avoids possible cuts, this allows a long term use of the device, free of discomfort. The device's user can wear it for many months, during a few hours a day. This way, the chance of a tissue expansion plus an elongated expansion in time are fundamental for the external male genitalia hipoplasia treatment.
